

Solid state sulfide Based LI-Metal batteries for EV applications

Deliverable 1.3 Initial Data Management Plan

Jens Ewald
FEV

Publishable summary

The SUBLIME Data Management Plan describes the process to handle data that is collected, processed, generated, shared, archived, or preserved. The description includes the methodology and the standards accompanying this process. A core task of the data management plan is to treat data in a so-called FAIR way to allow data to be findable, accessible, interoperable, and reusable as much as possible. While in the first part of this report the generic boundaries and principles used in this project are explained, the second part lists the application of those into each working package. Towards the end of the project a finalized version will be submitted as a separate Deliverable (D1.5).
